

# Cognitive Systems

Wadim Halik, Maik Schünemann,  
Yaoxin Zhao, Tchambo Hubert Fred

28. Mai 2014

# Inhaltsverzeichnis

- 1 Improvements over Ex1
- 2 The Idea for Ex2
- 3 The Structure of the Model
- 4 Exemplifying our System

# Improvements over Ex1

- No sequential search

# Improvements over Ex1

- No sequential search
- Added peripheral sight

# Improvements over Ex1

- No sequential search
- Added peripheral sight
- Added focus sight

# Improvements over Ex1

- No sequential search
- Added peripheral sight
- Added focus sight
- Added middle-circular recognition

# The Idea for Ex2

- The cognitive structure shall be given short-timed-memory and simple visual routine recognition

# The Idea for Ex2

- The cognitive structure shall be given short-timed-memory and simple visual routine recognition
- It should memorize the last question and its outcome

# The Idea for Ex2

- The cognitive structure shall be given short-timed-memory and simple visual routine recognition
- It should memorize the last question and its outcome
- It should recognize at least these visual routines:  
lines up to 5x, squares up to 5x5 and a simple cross

# The Idea for Ex2

- The cognitive structure shall be given short-timed-memory and simple visual routine recognition
- It should memorize the last question and its outcome
- It should recognize at least these visual routines:  
lines up to 5x, squares up to 5x5 and a simple cross
- Wide peripheral sight detects colors and focus sight detects visual routines

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape
- The system checks if it already knows the number or one of them

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape
- The system checks if it already knows the number or one of them
- The visual input is being analyzed by the peripheral sight

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape
- The system checks if it already knows the number or one of them
- The visual input is being analyzed by the peripheral sight
- Now the focus sight system examines those points the peripheral sight pointed out

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape
- The system checks if it already knows the number or one of them
- The visual input is being analyzed by the peripheral sight
- Now the focus sight system examines those points the peripheral sight pointed out
- The focus sight looks for visual routines and counts all matching objects

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape
- The system checks if it already knows the number or one of them
- The visual input is being analyzed by the peripheral sight
- Now the focus sight system examines those points the peripheral sight pointed out
- The focus sight looks for visual routines and counts all matching objects
- The outcome of the last search is passed to the short-timed memory unit

# The Structure of the Model

- The system recognizes the question, memorizes the color and the shape
- The system checks if it already knows the number or one of them
- The visual input is being analyzed by the peripheral sight
- Now the focus sight system examines those points the peripheral sight pointed out
- The focus sight looks for visual routines and counts all matching objects
- The outcome of the last search is passed to the short-timed memory unit
- The system answers the question

# Exemplifying our System

- We ask our System: "How many black circles are there?"

# Exemplifying our System

- We ask our System: "How many black circles are there?"
- Live...

# Exemplifying our System

- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles are there?"

# Exemplifying our System

- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles are there?"
- Live...

# Examplifying our System

- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles and blue circles are there" ?

# Examplifying our System

- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles and blue circles are there" ?
- It responds ...

# Examplifying our System

- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles are there?"
- Live...
- We ask our System: "How many black circles and blue circles are there" ?
- It responds ...
- We ask our System: "How many yellow squares are there" ?

# Examplifying our System
